Resolution

What Happens With Resolution?

- So resolution is nice, but what is happening when we do it?
- What does a set of clauses mean?
 - 1 $\{A, B\}$
 - 2 $\{\sim A, \sim B, C\}$
 - 3 $\{\sim C, D\}$
- This set of clauses equivalent to the single WFF (sorry if I get
() wrong sometimes)
 $((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)$

What Happens With Resolution?

- So what happens when we do resolution?
 - 1 $\{A, B\}$
 - 2 $\{\sim A, \sim B, C\}$
 - 3 $\{\sim C, D\}$
 - 4 $\{\sim A, \sim B, D\}$ from 2,3
- This set of clauses equivalent to the single WFF
 $((((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D)))$
- So we have just added the new clause to the end of the WFF

What Happens With Resolution?

- Resolution is built on the rule (not an S/I rules but S/I can prove this)
 $((P \vee Q) * (\sim P \vee R)) \Rightarrow (Q \vee R)$
- It is extended to more than one *

What Happens With Resolution?

- 1 {A, B}
- 2 { \sim A, \sim B, C}
- 3 { \sim C, D}

To

- 1 {A, B}
- 2 { \sim A, \sim B, C}
- 3 { \sim C, D}
- 4 { \sim A, \sim B, D} from 2,3

What Happens With Resolution?

- Is the same as saying

$$\begin{aligned} & (((A \vee B) * (\sim A \vee \sim B \vee C)) * (\sim C \vee D)) \Rightarrow \\ & (((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D))) \end{aligned}$$

- So every step of resolution we add another \Rightarrow and another term to the end
- Can't generate new terms: invalid
- Get the empty clause: valid (negation goes backwards and says we can't assume the conclusion is false so it must be true)

What Happens With Resolution?

- Why not do 1,2?
1 {A, B}
2 { \sim A, \sim B, C}
3 { \sim C, D}
4 { \sim A, \sim B, D} from 2,3
5 {A, \sim A, C} from 1,2
- This set of clauses equivalent to the single WFF
$$((((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D))) * ((A \vee \sim A) \vee C))$$

What Happens With Resolution?

- But $P \vee \sim P = T$ $T \vee P = T$ $T * P = P$

so

$(((((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D)))) * ((A \vee \sim A) \vee C))$

becomes

$(((((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D)))) * (T \vee C))$

$(((((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D)))) * T)$

$(((((A \vee B) * (\sim A \vee (\sim B \vee C))) * (\sim C \vee D)) * (\sim A \vee (\sim B \vee D))))$

Which is what we started with, so no information is gained

What Happens With Resolution?

- Similarly because $P * P = P$ we don't want to generate the same clause more than once (say we did 2,3 again)

$(((((A \vee B) * (\neg A \vee (\neg B \vee C))) * (\neg C \vee D)) * (\neg A \vee (\neg B \vee D)))) * (\neg A \vee (\neg B \vee D)))$

Is equivalent to what we started with

$(((((A \vee B) * (\neg A \vee (\neg B \vee C))) * (\neg C \vee D)) * (\neg A \vee (\neg B \vee D))))$
