6) We need to test if the computation at a is consistent with the known XOR Schoviaer. For that, we need to replace p with Soolean values, T and F. (a) says:  $XOR p(NOTp) \Rightarrow p(\lambda gr. pgr)(\lambda gr. prg)$ tor p = T: p (dgr.pgr) (dgr.prg) (T. hoors first) = I (19r. Tgr) (19r. Trg) => 2 /2r. Ter => 12r.2 三丁 For p= F: p (dgr.pgr) (dgr.prg) (7 chooses second)  $\equiv \mp (\lambda_9 r. F_9 r) (\lambda_9 r. \mp r_9)$ = 73 2gr. Frg =73/24.2 = T In both cases, xor dehaves as expected.

```
(define count-inversions
  (lambda (l)
    (if (null? l)
        (+ (count-smaller (car l) (cdr l)) (count-inversions (cdr l)))))
(define count-smaller
