### ARM's Flow Control Instructions (Unconditional Branch)

- □ ARM's unconditional branch instruction has the form B target, where target denotes the branch target address which is the address of the next instruction to be executed.
- ☐ The following fragment of code demonstrates how the unconditional branch is used.

```
.. do this   ;Some code
.. then that  ;Some other code
B Next  ;Now skip past next instructions
.. ;...the code being skipped
.. ;...the code being skipped
.. ;Target address for the branch
```

- ☐ In a high-level language, the unconditional branch is called a *goto*, which is considered a poor programming style;
- □ Yet, in assembly, the unconditional branching is unavoidable,
  - Assembly is a low-level language which <u>does not</u> have
     built-in constructs such as if ...then.. else, while, repeat, for, ...

#### Clements

Inc. Y by 2 ELSE

CMP X, Y

THEN

## ARM's Flow Control Instructions (Conditional Branch)

- □ Consider the following if statement, IF (X == Y) THEN Y = Y + 1 ELSE Y = Y + 2
- ☐ A test is performed, and one of the two courses of action is carried out depending on the test outcome.
- ☐ We can translate this as:

81

#### ARM's Flow Control Instructions (Conditional Branch)

- ☐ The **conditional branch** instruction
  - tests the flag bits (condition codes) in the current program status register
     (CPSR), then
  - o takes the branch if the tested condition is true.
- □ ARM dedicates 4 bits in each instruction to encode
  - 16 different conditions in total
    - o *eight* possible conditional branches based on the state of a *single bit*, namely Zero bit (Z), Negative bit (N), Carry bit (C), and oVerflow bit (V):
      - four that branch on true and
      - four that branch on false.
    - o **six** compound conditional branches
    - o **one** always branch (unconditional)
    - o *one* never branch (reserved)

### ARM's Flow Control Instructions (Conditional Branch)

**TABLE 3.2** 

ARM's Conditional Execution and Branch Control Mnemonics

	Encoding	Mnemonic	Branch on Flag Status	Execute on condition
	0000	EQ	Z set	Equal (i.e., zero)
	0001	NE	Z clear	Not equal (i.e., not zero)
	0010	CS	C set	Unsigned higher or same
	0011	CC	C clear	Unsigned lower
	0100	MI	N set	Negative
	0101	PL	N clear	Positive or zero
	0110	VS	V set	Overflow
	0111	VC	V clear	No overflow
	1000	HI	C set and Z clear	Unsigned higher
	1001	LS	C clear or Z set	Unsigned lower or same
	1010	GE	N set and V set, or N clear and V clear	Greater or equal
	1011	LT	N set and V clear, or N clear and V set	Less than
	1100	GT	Z clear, and either N set and V set, or N clear and V clear	Greater than
	1101	LE	Z set, or N set and V clear, or N clear and V set	Less than or equal
	1110	AL		Always (default)
lido	1111	NV		Never (reserved)

8

ad R. El-Sakka.

- □ Nothing illustrates the concept of flow control better than the classic loop constructs that are at the core of so-called structured programming.
- ☐ The following demonstrate the structure of
  - □ WHILE loop,
  - □ REPEAT-UNTIL loop, and
  - ☐ FOR loop

85

Exit loop

### ARM's Flow Control Instructions (Branching and Loop Constructs)

#### The WHILE loop example

```
While
           CMP r0, #0 ; perform test at start of loop
               Exit
                             ; exit
           BNE
           code ...
                             ; body of the loop
           B While ;loop again WHILE true
Exit
           Post-loop ... ;Exit
                                                         False
WHILE(r0 == 0)
                                             Condition
{ code:
                                                  True
WHILE(condition is TRUE)
                                            The body of the
                                             WHILE loop
{ The body of the WHILE loop;
```

#### The REPEAT-UNTIL loop example

```
Repeat
              code
                                   ; body of the loop
              CMP r0, #0
                                  ;perform test at end of loop
              BNE
                     Repeat
                                   ;loop again UNTIL true
Exit
              Post-loop ...
                                  ;Exit
 C and Java implement this loop using
DO {code} WHILE (condition is TRUE)
                                                          The body of
REPEAT
                                                        the REPEAT loop
 { code;
                      In C and Java, the
\} UNTIL (r0 == 0
                     looping occurs when
                     the condition is true
                                                   False
                      and exiting the loop
                                                          Condition
                       when it is false.
REPEAT
                                                                          86
{ The body of the REPEAT loop;
                                                                 True
} UNTIL (condition is TRUE)
                                                             Exit
```

This slide is modified from the original slide by the author A. Clements and used with permission. New content added and copyrighted by Mahmoud R. El-Sakka.

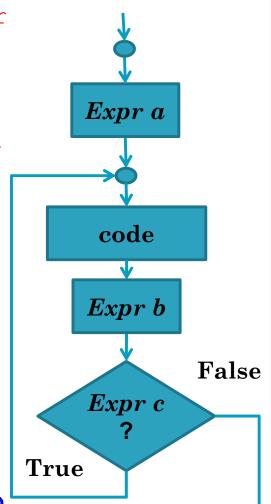

#### The FOR loop example

```
Loop code ... ;body of the loop

SUBS r0,r0,#1 ;decrement loop counter,
;set flags
BNE Loop ;continue until
;count zero
Post loop ... ;fall through on
;zero count
```

This FOR loop is different than the C and Java FOR loop.

The C and Java FOR loop has "Expr c" at the beginning of the loop, not at the end of it.

#### The combination loop example

```
MOV r0,#10 ;set up the loop counter

CMP r1,#0 ;perform test at start of loop

BNE ComboExit ;exit on test true

code ... ;body of the loop

CMP r2,#0 ;perform test at end of loop

BEQ ComboExit ;exit on test true

SUBS r0,r0,#1 ;decrement loop counter, set flags

BNE LoopStart ;continue until count zero

ComboExit Post loop ... ;Exit
```
